of the same data cable and specific software to transfer / receive message and monitor/controlling external parameters in a system. Additionally, the invention is compatible with ATA/ATAPI by using of ATA protocol or side-band protocol to make a main system communicates with other device(s) through original ATA/ATAPI device; s data cable.

The invention provides a solution/device of controlling external parameters by using

Also, the invention is using by the system; s data cables and non-standard controlling sequence to transfer and receive message by the same cable to connect with the external devices for monitoring/controlling external parameters. Hence, those advantages are data wires in the invention shall be reduced and simplified loops. Also, the invention can decrease the manufacture costs and get a better heating dissipation.
